### About

# Summary

This report has been prepared for Faraland smart contracts, to discover issues and vulnerabilities in the source code of their Smart Contract as well as any contract dependencies that were not part of an officially recognized library. A comprehensive examination has been performed, utilizing Static Analysis and Manual Review techniques.

The auditing process pays special attention to the following considerations:

- Testing the smart contracts against both common and uncommon attack vectors.
- Assessing the codebase to ensure compliance with current best practices and industry standards.
- Ensuring contract logic meets the specifications and intentions of the client.
- Cross referencing contract structure and implementation against similar smart contracts produced by industry leaders.
- Thorough line-by-line manual review of the entire codebase by industry experts.

The security assessment resulted in findings that ranged from critical to informational. We recommend addressing these findings to ensure a high level of security standards and industry practices. We suggest recommendations that could better serve the project from the security perspective:

- Enhance general coding practices for better structures of source codes;
- Add enough unit tests to cover the possible use cases given they are currently missing in the repository;
- Provide more comments per each function for readability, especially contracts are verified in public;
- Provide more transparency on privileged activities once the protocol is live.

# Overview

## Project Summary

|              |   |
|--------------|---|
| Project Name | Faraland  |
| Platform     | BSC   |
| Language     | Solidity  |
| Codebase     | <a href="https://github.com/ensete/moonknights-sc">https://github.com/ensete/moonknights-sc</a>   |
| Commits      | <ol style="list-style-type: none"><li>d4f0e82b0dac3e32d26d05c124c5f772647bb321</li><li>f0e0531b1989d1e20df7526ac824931b23215dd5</li></ol> |

## Audit Summary

|                   |                                |
|-------------------|--------------------------------|
| Delivery Date     | May 23, 2021                   |
| Audit Methodology | Static Analysis, Manual Review |
| Key Components    |                                |

## Vulnerability Summary

|                 |   |
|-----------------|---|
| Total Issues    | 8 |
| ● Critical      | 0 |
| ● Major         | 1 |
| ● Medium        | 3 |
| ● Minor         | 2 |
| ● Informational | 2 |
| ● Discussion    | 0 |

## Audit Scope

| ID  | file                           | SHA256 Checksum  |
|-----|--------------------------------|--|
| ECK | equipment/Equipment.sol        | 1f177043682bd4e6eec0aad75134486c23b2942f83f4e8c1124d686043c22900 |
| ERC | equipment/libs/ERC1155.sol     | e6856fd10e60796174091a447998c822e996bd23dcd9e7e0997be1d832fbd234 |

| TWC | utils/TokenWithdrawable.sol    | 6213143a6ec830cd18f8b9517412d1bcf467d0a58d57408e6f654dcf64a4e2c1 |

To set up the project correctly, improve overall project quality and preserve upgradability, the following roles, are adopted in the codebase:

`operator`, is adopted to mint, return, and equip equipment in `Equipment`.

`operator`, is adopted to generate and level up knights in `MoonKnight`.

`owner`, is adopted to update configurations, fees and create items in `Equipment`.

`owner`, is adopted to set up and manage the vendor in `EquipmentVendor`.

`owner`, is adopted to update configurations and fees in `MoonKnight`.

`owner`, is adopted to set MoonKnight contract in `StakingExpPool`.

`owner`, is adopted to set the accepted token in `AcceptedToken`.

`owner`, is adopted to manage operators in `PermissionGroup`.

`owner`, is adopted to manage the blacklist in `TokenWithdrawable`.

`knightOwner`, is adopted to manage users' own knights in `MoonKnight`.

To improve the trustworthiness of the project, any dynamic runtime updates in the project should be notified to the community. Any plan to invoke the aforementioned functions should be also considered to move to the execution queue of `TimeLock` contract.

# Findings

|  |            |

| ECK-03        | Corner Case for Non-Contract Caller Check    | Volatile Code                     | ● Informational | ⓘ Acknowledged        |
| <b>ECK-04</b> | Centralization Risk                          | <b>Centralization / Privilege</b> | ● <b>Medium</b> | ⓘ <b>Acknowledged</b> |
| ECK-05        | Lack of Upper Bound Check for Input Variable | Logical Issue                     | ● Minor         | ⓘ Acknowledged        |
| MKC-01        | Redundant Comparison to Boolean Constant     | Coding Style                      | ● Informational | ☑ Resolved            |
| MKC-02        | Lack of Reentrancy Check                     | Logical Issue                     | ● Major         | ☑ Resolved            |
| MKC-03        | Lack of Upper Bound Check for Input Variable | Logical Issue                     | ● Minor         | ⓘ Acknowledged        |

## ECK-01 | Incorrect Fee

| Category      | Severity | Location                     | Status     |
|---------------|----------|------------------------------|------------|
| Logical Issue | ● Medium | equipment/Equipment.sol: 122 | ✓ Resolved |

### Description

`rollEquipmentGacha()` will mint random equipment. However it charges `upgradeFeeInToken`, rather than `mintFeeInToken`.

### Recommendation

We advise the client to double check the fee mechanism to make sure the fee charging is reasonable.

### Alleviation

The client heeded the advice and resolved this issue in commit `f0e0531b1989d1e20df7526ac824931b23215dd5`.

## ECK-02 | Potential Over Mint

| Category      | Severity | Location                         | Status     |
|---------------|----------|----------------------------------|------------|
| Logical Issue | ● Medium | equipment/Equipment.sol: 109~110 | ✓ Resolved |

### Description

It is dangerous to change `balances` without checking `item.maxSupply` and `item.minted`. Suppose an item has the property `maxSupply=10` and `minted=9`. The operator then call `mint(account, id, 1)`. This will update `item.minted=10`. Users can still call `upgradeItem()` to burn the last tier of this item to mint this item. This will cause `minted > maxSupply`.

### Recommendation

We advise the client to check `item.maxSupply` and `item.minted` before updating `balances` and `_items.minted`.

### Alleviation

The client heeded the advice and resolved this issue in commit `f0e0531b1989d1e20df7526ac824931b23215dd5`.

## ECK-03 | Corner Case for Non-Contract Caller Check

| Category      | Severity        | Location                     | Status         |
|---------------|-----------------|------------------------------|----------------|
| Volatile Code | ● Informational | equipment/Equipment.sol: 117 | ⓘ Acknowledged |

### Description

`isContract()` cannot 100% guarantee the caller is a non-contract user, since `EXTCODESIZE` returns 0 if it is called from the constructor of another contract. Please consider if this is a problem for the project.

### Recommendation

We advise the client to be skeptical about the return value of `isContract()`.

### Alleviation

N/A

## ECK-04 | Centralization Risk

| Category                   | Severity | Location                               | Status         |
|----------------------------|----------|--|----------------|
| Centralization / Privilege | ● Medium | equipment/Equipment.sol: 125, 145, 138 | 📄 Acknowledged |

### Description

The role `operator` has the authority to mint and burn arbitrary equipment. In `returnItems()`, the operator can even mint equipment without the limitation of `item.maxSupply`.

### Recommendation

We advise the client to handle the governance account carefully to avoid any potential hack. We also advise the client to consider the following solutions:

1. `TimeLock` with reasonable latency for community awareness on privileged operations;
2. Multisig with community-voted 3rd-party independent co-signers;
3. DAO or Governance module increasing transparency and community involvement;

### Alleviation

**[Faraland Team]:** After the system is running smoothly, we will consider to pass the owner key to our community through a DAO contract, that can adjust all the parameters in the SC. Operators are trusted to operate for the best interest of the whole platform.

## ECK-05 | Lack of Upper Bound Check for Input Variable

| Category      | Severity | Location                        | Status         |
|---------------|----------|---------------------------------|----------------|
| Logical Issue | ● Minor  | equipment/Equipment.sol: 48, 53 | ⓘ Acknowledged |

### Description

The role `owner` can set the following state variables arbitrary large causing potential risks in fees :

- `upgradeFeeInToken`
- `mintFeeInToken`

### Recommendation

We recommend setting upper bound and check the input variable `fee`.

### Alleviation

**[Faraland Team]:** We want these parameters to be flexible based on the price of our token.

## MKC-01 | Redundant Comparison to Boolean Constant

| Category     | Severity        | Location                            | Status     |
|--------------|-----------------|-------------------------------------|------------|
| Coding Style | ● Informational | knight/MoonKnight.sol: 145~146, 165 | ✓ Resolved |

### Description

`_validateStr()` returns a Boolean value. Boolean value can be used directly and do not need to be compare to true or false. For example, `require(_validateStr("certik", false))` is valid.

### Recommendation

We recommend removing the equality to the Boolean constant.

### Alleviation

The client heeded the advice and resolved this issue in commit `f0e0531b1989d1e20df7526ac824931b23215dd5` .

## MKC-02 | Lack of Reentrancy Check

| Category      | Severity | Location                                  | Status     |
|---------------|----------|---|------------|
| Logical Issue | ● Major  | knight/MoonKnight.sol: 212, 280, 239, 265 | ✓ Resolved |

### Description

Calling `MoonKnight.buy()`, `MoonKnight.sacrificeKnight()`, `MoonKnight.cancelOffer()` and `MoonKnight.takeOffer()` might trigger function `address.call{}()`, which is implemented by the third party. If there are vulnerable external calls in the third party, reentrancy attacks could be conducted because these four functions have state updates and event emits after external calls.

The scope of the audit would treat the third-party implementation as a black box and assume its functional correctness. However, third parties may be compromised in the real world that leads to assets lost or stolen.

### Recommendation

We recommend applying OpenZeppelin ReentrancyGuard library - `nonReentrant` modifier for the aforementioned functions to prevent reentrancy attack.

### Alleviation

The client heeded the advice and resolved this issue in commit

`f0e0531b1989d1e20df7526ac824931b23215dd5` .

## MKC-03 | Lack of Upper Bound Check for Input Variable

| Category      | Severity | Location                        | Status         |
|---------------|----------|---------------------------------|----------------|
| Logical Issue | ● Minor  | knight/MoonKnight.sol: 106, 110 | ⓘ Acknowledged |

### Description

The role `owner` can set the following state variables arbitrary large or small causing potential risks:

- `setFloorPriceCap`
- `setServiceFee`

### Recommendation

We recommend setting proper ranges and check the input variable `value`.

### Alleviation

**[Faraland Team]:** We want these parameters to be flexible based on the price of our token.

# Appendix

## Finding Categories

### Centralization / Privilege

Centralization / Privilege findings refer to either feature logic or implementation of components that act against the nature of decentralization, such as explicit ownership or specialized access roles in combination with a mechanism to relocate funds.

### Logical Issue

Logical Issue findings detail a fault in the logic of the linked code, such as an incorrect notion on how `block.timestamp` works.

### Volatile Code

Volatile Code findings refer to segments of code that behave unexpectedly on certain edge cases that may result in a vulnerability.

### Coding Style

Coding Style findings usually do not affect the generated byte-code but rather comment on how to make the codebase more legible and, as a result, easily maintainable.

## Checksum Calculation Method

The "Checksum" field in the "Audit Scope" section is calculated as the SHA-256 (Secure Hash Algorithm 2 with digest size of 256 bits) digest of the content of each file hosted in the listed source repository under the specified commit.

The result is hexadecimal encoded and is the same as the output of the Linux `"sha256sum"` command against the target file.

# Disclaimer

This report is subject to the terms and conditions (including without limitation, description of services, confidentiality, disclaimer and limitation of liability) set forth in the Services Agreement, or the scope of services, and terms and conditions provided to the Company in connection with the Agreement. This report provided in connection with the Services set forth in the Agreement shall be used by the Company only to the extent permitted under the terms and conditions set forth in the Agreement. This report may not be transmitted, disclosed, referred to or relied upon by any person for any purposes without CertiK's prior written consent.

This report is not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. This report is not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team or project that contracts CertiK to perform a security assessment. This report does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors, business, business model or legal compliance.

This report should not be used in any way to make decisions around investment or involvement with any particular project. This report in no way provides investment advice, nor should be leveraged as investment advice of any sort. This report represents an extensive assessing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk. CertiK's position is that each company and individual are responsible for their own due diligence and continuous security. CertiK's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies, and in no way claims any guarantee of security or functionality of the technology we agree to analyze.

## About

Founded in 2017 by leading academics in the field of Computer Science from both Yale and Columbia University, CertiK is a leading blockchain security company that serves to verify the security and correctness of smart contracts and blockchain-based protocols. Through the utilization of our world-class technical expertise, alongside our proprietary, innovative tech, we're able to support the success of our clients with best-in-class security, all whilst realizing our overarching vision; provable trust for all throughout all facets of blockchain.
